## Scientific Name: Polianthes tuberosa

### Oil Origin and Extraction

The delicate Tuberose Absolute oil is harvested from the pristine blooms of the *Polianthes tuberosa*, a plant native to Mexico. The extraction of this exquisite oil is a meticulous process, traditionally performed through solvent extraction. This method enables the capturing of the tuberose's intoxicating fragrance, along with its therapeutic properties, which otherwise are too fragile to extract using steam distillation.

### Characteristics and Odor

Tuberose Absolute is known for its enchanting aroma that resembles a bouquet of freshly cut flowers. Its scent profile is rich, creamy, and deeply floral with sweet and exotic undertones. The consistency of this essential oil tends to be thick and viscous, reflecting the richness of the flower itself.

## **Country of Origin and Evaporation**

Primarily, Tuberose Absolute is sourced from India, although its cultivation extends to various parts of the world, including China and France. The evaporation rate of this oil is slow, allowing the fragrance to linger in the air, making it an ideal choice for long-lasting perfumes and aromatic blends.

## Aromatic Constituents

The complexity of Tuberose Absolute is attributed to its diverse chemical composition. Major constituents include methyl benzoate, methyl salicylate, and farnesol. These components are responsible not only for the alluring fragrance but also for the oil's therapeutic benefits, including enhancing mood and relieving stress.
